AI EMPLOYEE FOR RESTAURANTS

Purchasing Manager

Turns tonight's count into tomorrow's orders at the best price across your suppliers, and checks every invoice so overcharges come back as credits.

28–35%
of restaurant sales goes to food

3–8%
typical full-service net margin

9 in 10
operators call food costs a significant challenge

How it works

1. **Count.** Staff enter what is on the shelf, or say it in chat.
2. **Order.** Purchase orders to par, cheapest supplier per item, every supplier's minimum met.
3. **Approve.** Orders under your limit go out by email. Bigger ones wait for the owner.
4. **Check.** Each invoice is matched to its order; overcharges become a credit request.

You stay in control

- Dollar limit for automatic orders
- Manager sign-off on credit requests
- Every order, approval and email logged
- Your own workspace, isolated at the database

What it catches

- A cheaper supplier for the same item, compared per unit
- Orders that would miss a supplier's minimum
- Prices billed above the agreed price
- Extra cases and items you never ordered

A sample week at a 90-seat bistro

Orders drafted from one count	**2 suppliers, $1,015**
Saved vs one-supplier ordering	**$38**
Overcharges caught, one invoice	**$95**
